## ABSTRACT

This report consists of oceanographic data and counts of the red tide organisms, *Gymnodinium breve*, for the period from July 1957 to January 1960. Methods of collecting and analyzing samples are described. Data on water temperature, water transparency, cloud amount, salinity, copper, inorganic phosphate, total phosphorus, and nitrate-nitrite nitrogen are presented. These data were collected as part of a study on the distribution and incidence of *G. breve* and related ecological conditions and extend the records reported in a previous paper from 1954 to 1960.

## INTRODUCTION

This presents counts of the red tide organism *Gymnodinium breve* Davis with associated oceanographic data. It is the fourth report on field studies of the Florida red tide by the U. S. Bureau of Commercial Fisheries. The first two reports were by Graham, Amison, and Marvin (1954) and Marvin (1955a). The third report by Finucane and Dragovich (1959) described the background and objectives of the present red tide investigations and recorded counts of *G. breve* and associated oceanographic data from 1954 to 1957. The purpose of these four publications, covering collections from 1949 to 1952 and from 1954 through 1959, is to make the basic data available.

Most of the earlier publications dealing with the red tide phenomenon

in Florida waters are listed by Hutton (1956). Ingle et al. (1959), Bein (1957), and University of Miami<sup>1</sup> represent more recent reports.

This report consists of two parts. Part I includes data from 81 stations (figs. 1-5, pages 9-11) within the 10-fathom curve extending from Anclote Key to Florida Bay. The data in Part II were obtained from 38 stations (figs. 6 and 7, page 105) located in Tampa Bay, adjacent rivers and neritic waters extending to the 20-fathom line.

The collection of data presented in Part II was initiated after a careful review of past red tide investigations

<sup>1</sup> Red tide studies, final report. Marine Laboratory, University of Miami, Coral Gables, Florida, 1957, 14 pp. (Report to the Florida State Board of Conservation, 57-18, unpublished.)

at a symposium of specialists in marine biology held at the Galveston Biological Laboratory on March 5-7, 1958. It was agreed that an intensive field study in a smaller geographic area might lead to a better understanding of red tide outbreaks.

Most of the station locations are in areas in which high concentrations of *G. breve* have been observed. During the period of this report two outbreaks of red tide occurred. The first, commencing in 1957 and lasting from the end of September through December, occurred chiefly in coastal waters and bays from Anclote Key south to the Shark River in the Florida Everglades. River mouths were affected to a lesser degree. The second outbreak occurred during September through December of 1959 in the coastal area between St. Petersburg Beach and Cape Romano. Both outbreaks caused heavy fish mortalities.

During the 1957 outbreak of red tide, experimental application of copper sulphate as a possible control measure was used in the coastal areas from Anclote Key to Cape Romano by the U. S. Bureau of Commercial Fisheries in cooperation with the Florida State Board of Conservation. Copper sulphate was distributed from planes, boats, and bridges in these areas. The results of the large-scale test in the St. Petersburg area were reported by Rounsefell and Evans (1958). As a result the copper concentrations recorded during this experimental application may not necessarily represent the natural levels of this element.

## METHODS

### Sampling techniques

The collections of water samples for determination of salinity, copper, total and inorganic phosphate-phosphorus, nitrate-nitrite nitrogen, and abundance of *G. breve* were made as described by Finucane and Dragovich (1959), except as indicated below.

For the data presented in Part I, the surface water samples were collected with a polyethylene bucket and subsurface samples with a weighted polyethylene container. In Part II, all water samples, except at river stations, for salinity, nitrate-nitrite nitrogen, and total and inorganic phosphate-phosphorus were collected with reversing Nansen water bottles. To eliminate metallic contamination, the water samples for *G. breve* counts and copper analyses continued to be collected in polyethylene containers, which were replaced during this investigation by modified Van Dorn sampling bottles (Van Dorn, 1957). Weighted polyethylene containers were used to secure all samples from the river stations. Water samples were collected from four evenly spaced depths, including surface and bottom. At river stations they were collected from surface and bottom only.

At all stations represented in Part I and at the river stations in Part II, water temperatures were measured with a mercury thermometer to the nearest 10th of a degree centigrade. In Tampa Bay and neritic stations in Part II, the water temperatures were recorded with a thermistor (Whitney underwater thermometer, model T65) to the nearest 10th of a degree centigrade.

### Enumeration of *Gymnodinium breve*

Water samples for *G. breve* counts were usually examined within 24 hours after collection. All of the samples were concentrated (the organisms given time to move to the surface of the sample) under 40-watt fluorescent lights. Satisfactory concentration of the organism was obtained with lights 14 inches above the flasks. The period of concentration at room temperature was usually 16-18 hours and never less than 4 hours.

Sample aliquots were examined for living organisms with a stereoscopic, inclined binocular microscope equipped with 18X wide-field eyepieces. For general detection and for counting of both concentrated and mixed samples, magnifications of 54X and 144X were

used. The technique was as follows:

1. After the samples had been concentrated, three to six 1-milliliter aliquots were pipetted from the area just beneath the surface of the water sample and each was deposited in the depression of a 3-depression micro-plate. Only one aliquot was taken during the blooms of *G. breve* when high concentrations of the organism visibly discolored the water sample. If no *G. breve* were found in these aliquots, the water sample was assumed to contain no *G. breve*, and the count was recorded as none (0). The symbol "P" is used to indicate the presence of the organism in the concentrated sample.

2. If *G. breve* were observed in the initial concentrated aliquots, the flask was inverted several times to redistribute the organisms throughout the sample of water in preparation for the mixed count. The counting technique assumes that after several inversions of the flask *G. breve* are randomly distributed. Then, depending on the numbers of *G. breve* per milliliter in the examination of the concentrated samples; i.e., 1-99, 100-1000, or more than 1000, aliquots of 1.0, 0.1, or 0.01 milliliter were pipetted from within the flask to a depression in a 3-depression micro-plate. The number of aliquots used in determining the mixed count was standardized at 5 or 10. Five aliquots were used during bloom periods of *G. breve*; 10 during non-bloom periods. The number of *G. breve* observed per milliliter or fraction thereof was then recorded for each aliquot. The arithmetic mean number of *G. breve* for all aliquots was shown as number per milliliter. When no organisms were present in the mixed sample, 0 was recorded. All counts were of living organisms.

### Chemical analysis

Salinities were determined by the Mohr-Knudsen method (Knudsen, 1901). Nitrate-nitrite nitrogen determinations were made by the method of Zwicker and Robinson (1944) as modified by Marvin (1955b).

The method of Robinson and Thompson (1948) was used to determine amounts of inorganic phosphates, and the method of Harvey (1948) was used in total phosphorus determinations. Copper determinations were by the analytical method of Hoste, Eackhout, and Gillis (1953).

## ACKNOWLEDGMENT

We are pleased to acknowledge the guidance and numerous suggestions of William B. Wilson, Chief of Red Tide Investigations for the Bureau of Commercial Fisheries. Dr. M. W. Jambor assisted in the enumeration of *G. breve*; J. A. Kelly, Jr. aided in the tabulation of data; and Lucius Johnson assisted in most of the chemical analyses.

The Florida State Board of Conservation, especially Ernest Mitts, Director; Robert M. Ingle, and Dr. Robert F. Hutton, cooperated in numerous instances by supplying patrol vessels, crews, and other facilities.

The authors are indebted to all participants of the Red Tide Symposium held on March 5-7, 1958, in Galveston, Texas for their assistance in review of past red tide research.

#### EXPLANATION OF COLUMN HEADINGS

##### Part I

Time      Eastern standard time.

S or B      Surface or bottom (occasionally M for mid-depth and actual depth in feet).

C.      Concentrated sample. Shows absence (0) or presence (P) of live cells in one to six 1-milliliter aliquots pipetted from surface of a 2-liter or smaller water sample after exposure from 4 to 24 hours (or more) to artificial light (40-watt fluorescent lamp 14 inches above surface of sample).

M.      Mixed sample. Average number of live cells per milliliter was recorded in 5 (or 10) 1-milliliter or fraction of milliliter aliquots. When no organisms were present in the mixed sample aliquots, 0 was used.

° C.

Sal.

Cu

PO<sub>4</sub>

In.

Tot.

NO<sub>3</sub>-NO<sub>2</sub>

##### Part II

All column headings are the same as in Part I, with the exception of the following:

Tr.

Water temperature in centigrade recorded to the nearest 10th of a degree.

Salinity, parts per thousand.

Copper,  $\mu\text{g.at./l.}$

Phosphate  
Inorganic phosphate,  $\mu\text{g.at.}$   
PO<sub>4</sub>-P/l.  
Total phosphate,  $\mu\text{g.at.}$   
PO<sub>4</sub>-P/l.

Nitrogen,  $\mu\text{g.at.}$  NO<sub>3</sub>-NO<sub>2</sub>-N/l.

Depth

Depth is coded as indicated below:

- 1 Surface
- 2 First intermediate
- 3 Second intermediate
- 4 Bottom

Cloud amount coded as indicated below:

- 0 No clouds
- 1 Less than 1/10 or 1/10
- 2 2/10 and 3/10
- 3 4/10
- 4 5/10
- 5 6/10
- 6 7/10 and 8/10
- 7 9/10 and 9/10 plus
- 8 10/10
- 9 Sky obscured

Water transparency in feet at which Secchi disc is visible, recorded to the nearest  $\frac{1}{2}$  foot.
